

Control component with static transducer and Modbus RTU interface

Compact device for use with VAV terminal units TVE

- Controller, static differential pressure transducer and actuator in one casing
- Use in ventilation and air conditioning systems, only with clean and contaminated air
- Simple terminal connection without the use of additional junction boxes
- Volume flow rates q_{vmin} and q_{vmax} are pre-set in the factory and saved in the controller as changed parameters
- High data transparency through standardised bus communication Modbus RTU, RS485
- Setpoint value settings, override controls, parameter adjustment via Modbus register
- Integrated display for volume flow rate display, operating mode display and setting of operating parameters
- Service access for manual adjustment devices and PC configuration software

General information

Application

- All-in-one control devices for VAV terminal units
- Static differential pressure transducer, electronic controller, and actuator are fitted together in one casing
- Static pressure transducer for broader range of applications with clean and contaminated air, e.g. in the outlet area with dust and fluff
- Suitable for different control tasks depending on the specification of the setpoint value
- The room temperature controller, central BMS, air quality controller or similar units control the variable volume flow control by specifying the setpoint values via a communication interface or analogue signal
- Override controls for activating q_{vmin}, q_{vmax}, shut-off, OPEN position via Modbus register or switch/ relay possible (depending on the interface configuration)
- Volume flow rate actual value is available as a network data point or linear voltage signal
- Damper blade position is available as a network data point

Control concept

- The volume flow controller works independent of the duct pressure
- Differential pressure fluctuations do not result in permanent volume flow rate changes
- To prevent the control from becoming unstable, a dead band is allowed within which the damper blade does not move.
- Flow rate range parameterised in the controller at the factory (q_{vmin}: minimum volume flow rate, q_{vmax}: maximum volume flow rate)
- Operating parameters are specified via the order code and parameterised in the factory

Operating modes

- Modbus (M): setpoint value specification via Modbus register
- Analogue variable operation (V): setpoint value specification via analogue interface, signal voltage range corresponds to q_{vmin} to q_{vmax}
- Analogue constant value mode (F): no setpoint value signal required, setpoint value corresponds to q_{vmin}

Interface

Communication interface

- Modbus RTU, RS485
- For data points, see Modbus register list

Analogue interface with adjustable signal voltage range

Analogue signal for volume flow rate setpoint value

- Analogue signal for volume flow rate actual value (factory setting)
- Alternatively: analogue signal for damper blade position (adjustment by others required)

Note

- Interface type according to operating mode pre-set in the factory
- Can be adjusted by others using the communication interface (Modbus register) or display panel.

Signal voltage ranges

When using the analogue interface

- 0 10V DC
- 2 10V DC

Parts and characteristics

- Transducer with static measurement principle
- Overload protection
- Terminals with cover
- Display and operating elements for simple menu guidance
- Menu guidance for adjusting operating parameters and communication interface
- Service interface

Construction

- TROVM-024T-05I-DS10-MB
- Can only be used for type TVE

Commissioning

- Due to the volume flow rates set in the factory, always ensure that the control units are only installed in the specified locations
- Analogue interface: ready for use after installation and wiring
- Modbus interface: additional commissioning steps required
- Operating parameters can be adjusted by the customer (using the display panel, adjustment device or Modbus register)
- Zero point correction not required

Useful additions

2

Adjustment device type GUIV3-M (order code AT-VAV-G3)

Function

A closed control circuit for regulation of the volume flow rate, i.e. measuring - comparing - adjusting, is characteristic of air terminal units. This is done via a differential pressure sensor. An integrated differential pressure transducer converts the effective pressure into a voltage signal. The factory setting is such that 10 V DC always corresponds to the nominal volume flow rate

 $(q_{\tiny{vnom}}).$ The volume flow rate setpoint value is specified by a higher-level controller (e.g. room temperature controller, air quality controller, central BMS). Variable volume flow control results in a value between $q_{\tiny{vmin}}$ and $q_{\tiny{vmax}}$. It is possible to override the room temperature control, e.g. by a complete shut-off of the duct. The controller compares the volume flow rate setpoint value to the actual value and controls the integral actuator accordingly.

- ① Differential pressure transducer
- ② Actuator
- 3 Volume flow controller

- Setpoint via Modbus or analogue signal
- Shaft with effective pressure channel

Specification text

This specification text describes the general properties of the product.

Category

- Compact controller for volume flow rate.
- Regulation of a constant or variable volume flow rate setpoint
- Electronic controller for connecting a controlled variable and tapping an actual value for integration in the central building management system
- The actual value relates to the nominal volume flow rate such that commissioning and subsequent adjustment are simplified
- Stand-alone operation or integration in central building management system

Application

- Static transducer for polluted air in ventilation and air conditioning systems
- Modbus-Modbus commands (Modbus operating mode)
- External switch contacts/wiring (with analogue interface)

Supply voltage

24 V AC / DC

Actuator

Integrated; slow running (running time 100 s for 90°)

Installation orientation

either direction

Interface/Control

- Modbus RTU (RS-485) or alternative analogue signals (0 10V or 2 – 10V DC) can be used
- Interface type pre-parameterised in the factory on the basis of the order code

Connection

- Terminals with cover by rubber cap, therefore no additional terminal box required
- Double terminal for supply voltage for easy further wiring of up to 3 controllers

Interface information

- Modbus: including volume flow rate setpoint value and actual value signal, damper blade position, override control
- Alternatively: volume flow rate setpoint value and actual value signal as analogue signal

Special functions

- Clearly visible external indicator light for signalling the functions: Set, not set, and power failure
- Display for actual values, parameterisation and for test functions
- Activation q_{vmin}, q_{vmax}, closed, open by: Modbus (with Modbus control), external switch contacts (with analogue control)

Parameter settings

- Parameters specific to VAV terminal unit parameterised at the factory
- Operating values: q_{vmin}, q_{vmax} and interface type parameterised in the factory
- Subsequent adjustment via display and control element directly on the device or with optional tools: adjustment device, PC software (wired in each case), in Modbus mode as well as via Modbus register access

Factory settings

4

- Electronic controller factory-mounted on the terminal unit
- Factory parameter settings
- Functional test under air; certified with sticker

Order code

1 Type

TVE VAV terminal unit

2 Acoustic cladding

No entry: none

D With acoustic cladding

3 Material

Galvanised sheet steel (Standard construction)

P1 Powder-coated RAL 7001, silver grey

A2 Stainless steel construction

5 Nominal size [mm]

100, 125, 160, 200, 250

6 Accessories

No entry: none

D2Double lip seal both sides

G2 Matching flanges for both ends

7 Attachments (control component)

XS0 Compact controller with static transducer, Modbus RTU, display

8 Operating mode

F Constant value (a setpoint value)

V Variable (setpoint value range)

M Modbus RTU

9 Signal voltage range (only with operating mode F, V)

0 0 - 10 V DC

2 2 - 10 V DC

10 Operating values for factory setting

Volume flow rates [m³/h or l/s]

q_{vconst} (only with operating mode F)

 $q_{\text{\tiny vmin}}$ (only with operating mode V, M)

 $q_{\tiny{vmax}}$ (only with operating mode V, M)

11 Volume flow unit

m³/h

l/s

Order example: TVE/100/D2/XS0/M/20-350 m³/h

Parity: None, Even, Odd Setpoint / actual value interface (Modbus) via Modbus register list	Setpoint / actual value interface (Modbus)	
Cable termination externally required		

Interface configuration of control components

Depending on the setting, the Modbus communication interface or the analogue interface are available for the setpoint value specification of volume flow rates. The so-called interface mode is preset at the factory according to the order code and can be adjusted on-site by setting via the menu navigation or the Modbus registers.

Typical interface configuration

XS0	Setpoint value setting via:	Actual values via:	corresponds to order key option	Menu configuration (Mode)
Analog operation	Analogue 0 – 10 V	Analogue 0 – 10 V	V or F	CA0
Analog operation	Analogue 2 – 10 V	Analogue 2 – 10 V	V or F	CA2
Modbus operation		Modbus register actual value or analog 2 - 10V	М	СВ

A special configuration of the Modbus register interface mode enables the configuration of a mixture of Modbus and analogue modes. For more information, see the description of the interface mode in Modbus register 122.

Supplementary use of the Modbus interface in analogue mode

In analogue mode, only the setpoint value settings are analysed on the analogue input. A setpoint value setting via the Modbus interface (register 0) is not possible. Any write attempts are acknowledged with an error response. Regardless of the selected interface configuration, however, the other Modbus registers can be used. In this way, the volume flow rate actual value and blade position operating values can be read out from a higher-order central BMS with local control via an analogue signal and a connected Modbus, or central override control can also be triggered.

Communication interface Modbus RTU (operating mode M)

^{**} factory setting: Modbus communication parameters

XS0, Display

Display range of functions Display functions

- Volume flow rate actual value (unit optionally m³/h, l/s, cfm)
- 3-character display with position valuation labelling
- Status and error display for various operating modes, including display of activated override control, display of diagnostic function
 Parameterisation functions
- Adjustment option for the unit of the volume flow rate display m³/h, l/s, cfm
- Adjustment option for the work area q_{vmin}, q_{vmax}
- Selection of the interface configuration Modbus or analogue including signal voltage range 0 10 V or 2 10 V DC
- Adjustment option for Modbus communication settings (address, baud rate, stop bits, parity)

Diagnosis

- Activation of a test run
- Activation of override controls Open, Closed, q_{vmin}, q_{vmax}, motor stop (note prioritisation)
- Display of the voltage value on the analogue input

Commissioning

Note on static transducer type used

- Installation orientation not critical
- Zero point correction not required

After installation, wiring and connection of the supply voltage

- When using the Modbus interface: set the Modbus communication parameters via the integrated menu, the air terminal unit is then ready
- Setpoint value setting via Modbus register
- When using the analogue interface: air terminal unit is immediately ready for use
- Comply with volume flow rate control range from 4 100 % of q_{vnenn;} do not set a volume flow rate which is below the minimum flow rate of the control unit
- Only briefly remove the protective cap of the control component during wiring

Product details

Modbus mode (order code, operating mode M)

For smooth data exchange in the Modbus RTU network, the communication parameters and user address must be set for the Modbus interface.

The interface offers standardised Modbus register access to the available data points via the functions ReadHoldingRegister (3) and WriteSingleRegister (6).

Setpoint value setting

- In the operating mode M, the setpoint value is only set by specifying the volume flow rate set point value [%] in the Modbus register 0.
- The transferred percentage value refers to the volume flow rate range specified by q_{vmin} q_{vmax}.
- Volume flow rate range q_{vmin} q_{vmax} is pre-set in the factory according to the order code entries.
- Subsequent adjustment of q_{vmin} or q_{vmax} is possible in the setup menu on the display, with the adjustment device or using the Modbus interface.

Actual value as feedback for monitoring or tracking control

- In Modbus register 7, the current actual volume flow rate can be called up in the set volume flow rate unit (register 201).
- In addition to the volume flow rate actual value, further information on other Modbus registers can be read out.
 For overview, see register list.
- For diagnostic purposes, the volume flow rate actual value can be tapped at terminal U in Modbus mode. The volume flow rate range $0 q_{vnom}$ here always corresponds to the signal voltage range of 2 10V DC.

Override control

For special operating situations, the volume flow controller can be put in a special operating mode (override control). The following are possible: control q_{vmin} , control q_{vmax} , damper blade in the OPEN position or damper blade CLOSED.

Override control via the Modbus

This is set via the Modbus register 1.

Override control via bus timeout monitoring

If the Modbus communication fails for a stipulated time period, a pre-defined operating mode q_{vmin} , q_{vmax} , OPEN or CLOSED can be activated.

- The override control to be activated upon bus failure is specified via register 108.
- The time period after which override control is activated upon bus failure is specified via register 109.
- Each Modbus communication resets the timeout of the bus failure monitoring.

Override controls for diagnostic purposes

Activation of the diagnostic menu on the display of the controller or via the service tools (adjustment device, PC software).

13

Prioritisation of various setting options

Settings for override controls via service tools are prioritised over Modbus settings.

- Highest priority: settings via the service connector (adjustment device, PC software) for test purposes
- Lowest priority: settings via Modbus 1 or the diagnostic menu on the controller

Analogue mode 0 - 10V DC or 2 - 10V DC (order code, operating mode V, F)

The analogue interface can be adjusted for the signal voltage range 0 – 10V DC or 2 – 10V DC.

The assignment of the volume flow rate setpoint value or actual value for voltage signals is shown in the characteristic curves.

- The set signal voltage range always applies equally for setpoint value and actual value signals.
- The signal voltage range is pre-set in the factory according to the order code entries.
- The signal voltage range can be adjusted by others in the setup menu on the display or using the adjustment device.

Setpoint value setting

- In operating mode V (variable mode), the setpoint value is only specified with an analogue signal on terminal Y.
 Setpoint value settings via the Modbus register 0 are rejected.
- The selected signal voltage range 0 10V or 2 10V DC is assigned to the volume flow rate range q_{wmin} q_{wmin} q_{wmin} a change packet.
- Volume flow rate range q_{vmin} q_{vmax} is pre-set in the factory according to the order code entries.
- Subsequent adjustment of q_{vmin} or q_{vmax} is possible in the setup menu on the display or using the adjustment device.
- In operating mode F (constant value mode), an analogue signal on terminal Y is not required.
- It is controlled by the volume flow rate constant value set by q_{vmin}.
- Volume flow rate q_{vmin} is pre-set in the factory according to the order code entry.
- Subsequent adjustment of querin is possible in the setup menu on the display or using the adjustment device.

Actual value as feedback for monitoring or tracking control

- On the terminal U, the actual volume flow rate measured by the controller can be tapped as a voltage signal.
- The selected signal voltage range 0 10V DC or 2 10V DC is shown in the volume flow rate range 0 q_{vnom}.
- In analogue mode (operating mode V, F) there is also the option of querying operating data using the Modbus interface.

Override control

For special operating situations, the volume flow controller can be put in a special operating mode (override control). The following are possible: control q_{wmax}, control q_{wmax}, damper blade in the OPEN position or damper blade CLOSED.

Override controls via signal input Y

With the appropriate wiring at signal input Y, the forced controls can be activated according to the connection diagrams by wiring with external switch contacts / relays (see wiring examples)

. OPEN and CLOSED are only available if the controller is supplied with alternating current (AC).

Override control CLOSED via control signal on control signal Y

- with signal voltage range 0 10 V DC: CLOSED is activated when q_{vmin} = 0 is set and the control signal is Y < 0.3V DC.
- with signal voltage range 2 10V DC: CLOSED is activated when control signal is Y < 0.8V (1) DC (1) 0.8V = factory setting

Override controls in analogue mode via Modbus interface

If the Modbus interface is additionally connected in analogue mode, an override control can also be specified via Modbus register 1.

14

Override control for diagnostic purposes

Activation via the diagnostic menu in the display of the controller or the service tools (adjustment device, PC software).

Prioritisation of various setting options

Various override control options are prioritised as follows by the controller:

- Highest priority: settings via the service connector (adjustment device, PC software) for test purposes
- Medium priority: settings via Modbus register 1 or the diagnostic menu on the controller
- Lowest priority: settings via wiring on the Y signal input of the controller

XS0, Characteristic of the setpoint value signal

- ① Signal voltage range 0 10 V DC
- ② Signal voltage range 2 10 V DC

Calculation volume flow rate setpoint value at 0 - 10 V:

$$0 - 10 \text{ V DC}$$

$$\dot{V}_{Soll} = \frac{Y}{10} (\dot{V}_{max} - \dot{V}_{min}) + \dot{V}_{min}$$

XS0, Characteristic of the actual value signal

- ① Signal voltage range 0 10 V DC
- ② Signal voltage range 2 10 V DC

Calculation volume flow rate actual value at 0 - 10 V:

$$\dot{V}_{lst} = \frac{U}{10} \dot{V}_{Nenn}$$

Calculation volume flow rate setpoint value at 2 – 10 V:

$$\dot{V}_{Soll} = \frac{Y-2}{8} (\dot{V}_{max} - \dot{V}_{min}) + \dot{V}_{min}$$

$$\dot{V}_{lst} = \frac{U-2}{8} \dot{V}_{Nenn}$$

Terminal connections with analogue operation 0 – 10 V or 2 – 10 V $\,$

Terminal connections for Modbus operation

S4 = Damper blade CLOSED (only with supply voltage 24 V AC)

S5 = Damper blade OPEN (only with supply voltage 24 V AC)

T, VOC, CO2, DDC = Setpoint value setting

When combining several override controls the switches must be interlocked to prevent short-circuits. Diode: e.g. 1N 4007

Explanation

 q_{vnom} [m³/h]; [l/s]

Nominal volume flow rate (100 %): The value depends on product type and nominal size. Values are published on the internet and in technical leaflets, and stored in the Easy Product Finder design software. Reference value for calculating percentages (e.g. qvmax). Upper limit of the setting range and maximum volume flow rate setpoint value for the VAV terminal unit.

q_{vmin Unit} [m³/h]; [l/s]

Technically possible minimum volume flow rate: The value depends on product type, nominal size and control component (attachment). Values are stored in the Easy Product Finder design software. Lower limit of the setting range and minimum volume flow rate setpoint value for the VAV terminal unit. Depending on the controller, setpoint values below qvmin unit (if qvmin equals zero) may result in unstable control or shut-off.

 q_{vmax} [m³/h]; [l/s]

Upper limit of the operating range for the VAV terminal unit that can be set by customers: qvmax can only be smaller than or equal to qvnom. In case of analogue signalling to volume flow controllers (which are typically used), the set maximum value (qvmax) is allocated to the setpoint signal maximum (10 V) (see characteristic).

 q_{vmin} [m³/h]; [l/s]

Lower limit of the operating range for the VAV terminal unit that can be set by customers: qvmin should be smaller than or equal to qvmax. Do not set qvmin smaller than qvmin unit, otherwise the control may become unstable or the damper blade may close. qvmin may equal zero. In case of analogue signalling to volume flow controllers (which are typically used), the set minimum value (qvmin) is allocated to the setpoint signal minimum (0 or 2 V) (see characteristic).

q_v [m³/h]; [l/s] Volume flow rate

 $\Delta_{\mbox{\tiny pst}}$ [Pa] Static differential pressure

 $\Delta_{\text{pst min}}$ [Pa]

17

Static differential pressure, minimum: The static minimum differential pressure is equal to the pressure loss of the VAV controller when the damper blade is open, caused by flow resistance (damper blade). If the pressure on the VAV controller is too low, the setpoint volume flow rate may not be achieved, not even when the damper blade is open. Important factor in designing the ductwork and in rating the fan including speed control. Sufficient differential pressure must be ensured for all operating conditions and for all controllers, and the measurement point or points for speed control must have been selected accordingly to achieve this.
